

Covid-19 Impacts On Structural Health Monitoring Market

Mahdi SAFA, Brian METROVICH

Structural health monitoring is an important process to ensure the safety of critical infrastructures, such as the vast network of highways, railways, wind turbines, utilities, and buildings. While this market is estimated to grow from \$2 billion to \$4 billion by 2027, this study provides an analysis and discusses the impact of COVID-19 on the overall structural health monitoring market. Besides the adverse impact of COVID-19, other contributing factors such as significant investments in the infrastructure sector, aging infrastructure, and stringent government regulations to build sustainable structures have been considered. The results of this study provide a viewpoint on upcoming trends, growth drivers, facts-derived restraints, opportunities, and challenges in the market within COVID-19.
